Understanding Differentiation Formulas in Class 12

Differentiation is the process of finding the derivative of a function, which measures how the function changes with respect to its variable. The derivative provides critical insights into the slope of curves, rates of change, and optimization problems. Below are the most important differentiation formulas that students need to learn.

Basic Differentiation Rules

The foundation of differentiation involves several basic rules:

- Constant Rule:

If c is a constant, then:

$$\frac{d}{dx} c = 0$$

- Power Rule:

If n is any real number, then:

$$\frac{d}{dx} x^n = n x^{n-1}$$

- Constant Multiple Rule:

If c is a constant and $f(x)$ is differentiable, then:

$$\frac{d}{dx} [c \cdot f(x)] = c \cdot f'(x)$$

- Sum and Difference Rule:

If $f(x)$ and $g(x)$ are differentiable, then:

$$\frac{d}{dx} [f(x) \pm g(x)] = f'(x) \pm g'(x)$$

Special Derivatives

Certain functions have well-known derivatives:

- $\frac{d}{dx} \sin x = \cos x$
- $\frac{d}{dx} \cos x = -\sin x$
- $\frac{d}{dx} \tan x = \sec^2 x$
- $\frac{d}{dx} \cot x = -\csc^2 x$
- $\frac{d}{dx} \sec x = \sec x \tan x$
- $\frac{d}{dx} \csc x = -\csc x \cot x$

Derivative of Exponential and Logarithmic Functions

- $\frac{d}{dx} e^x = e^x$
- $\frac{d}{dx} a^x = a^x \ln a$, where $a > 0$
- $\frac{d}{dx} \ln x = \frac{1}{x}$, for $x > 0$
- $\frac{d}{dx} \log_a x = \frac{1}{x \ln a}$

Differentiation of Composite, Product, and Quotient Functions

- Chain Rule:

If $y = f(g(x))$, then:

$$\frac{dy}{dx} = f'(g(x)) \cdot g'(x)$$

- Product Rule:

If $y = u(x) \cdot v(x)$, then:

$$\frac{dy}{dx} = u'v + uv'$$

- Quotient Rule:

If $y = \frac{u(x)}{v(x)}$, then:

$$\left(\frac{dy}{dx} = \frac{u'v - uv'}{v^2} \right)$$

Key Integration Formulas in Class 12

Introduction to Differentiation and Integration

Differentiation and integration are two fundamental operations in calculus that are interconnected through the Fundamental Theorem of Calculus.

- Differentiation involves finding the rate at which a function changes with respect to its variable. It answers questions like how fast or how steep a curve is at a particular point.
