6. User Identification or Verification

Based on the matching results, the system confirms or verifies the identity.

Developing Multi Biometric Identification Source Code in MATLAB

Creating a multi-biometric system in MATLAB involves writing modular, reusable code for each component. Here's a step-by-step guide:

1. Data Collection and Storage

Use MATLAB functions to load and store biometric data:

```
``matlab

% Example for loading fingerprint images

fingerprintData = dir('dataset/fingerprints/.png');

for i = 1:length(fingerprintData)

img = imread(fullfile('dataset/fingerprints', fingerprintData(i).name));

% Store or process the image

end

``
```

2. Preprocessing Modules

Preprocessing functions tailored for each modality:

```
``matlab
```

% Example for image normalization

```
function processedImage = preprocessImage(image)
```

```
processedImage = imadjust(image); % enhances contrast
```

```
processedImage = imgaussfilt(processedImage, 2); % smoothens image
```

```
end
```

```
...
```

3. Feature Extraction Techniques

Implement feature extraction algorithms:

- Fingerprint Minutiae Extraction:

```
```matlab
```

```
% Skeletonization and minutiae detection
```

```
skeleton = bwmorph(binaryImage, 'skel', Inf);
```

```
minutiaePoints = detectMinutiae(skeleton);
```

```
...
```

- Facial Landmarks:

```
```matlab
```

```

```
```

5. Matching Algorithms

Implement similarity measures:

```
```matlab

% Euclidean distance for feature vectors

if distance
 match = true;

else

 match = false;

end
```

```
'''
```

## 6. Decision Making and User Interface

Design a simple interface for user interaction:

```
```matlab

% Simple prompt

userID = input('Enter user ID: ', 's');

if match

disp(['User ', userID, ' recognized successfully.']);

else

disp('Recognition failed.');
```

end

```
'''
```

Understanding Multi-Biometric Identification

What is Multi-Biometric Identification?

Multi-biometric identification involves the simultaneous use of multiple biometric traits to recognize individuals. Unlike unimodal systems that rely on a single trait?such as fingerprints?the multi-modal approach combines data from different sources to achieve higher accuracy, enhanced security, and improved resilience to noise or spoofing.

Why Use Multi-Biometric Systems?

- Increased Accuracy: Combining multiple traits reduces the likelihood of false positives and false negatives.
- Enhanced Security: Difficult to spoof multiple biometric traits simultaneously.
- Robustness to Variability: Accommodates variations in biometric data caused by aging, environmental factors, or sensor quality.
- User Convenience: Flexibility for users to authenticate via multiple modalities.

Common Biometric Modalities

- Fingerprint
- Face Recognition
- Iris Scan
- Voice Recognition
- Palmprint

Core Components of a Multi-Biometric Identification System in Matlab

Implementing a multi-biometric system involves several key modules, each critical to overall system performance:

- Data Acquisition
 - Collect biometric data from different modalities.
 - Handle image or signal inputs, possibly from datasets or real-time sensors.
- Preprocessing

- Enhance image quality.
- Normalize data to ensure consistency.
- Remove noise and artifacts.

- Feature Extraction

- Extract discriminative features from each modality.
- Use algorithms like Gabor filters, Wavelet transforms, or Local Binary Patterns (LBP) for images.
- For signals, employ Fourier or Mel-Frequency Cepstral Coefficients (MFCCs).

- Feature Fusion

- Combine features from multiple modalities.
- Fusion can occur at different levels:
 - Sensor-level: Raw data fusion.
 - Feature-level: Concatenate feature vectors.
 - Score-level: Combine matching scores.
 - Decision-level: Fuse final decisions.

- Classification and Matching

- Use classifiers like Support Vector Machines (SVM), K-Nearest Neighbors (KNN), or Neural Networks.
- Compute similarity scores between input features and stored templates.

- Decision Making

- Apply fusion rules or thresholds to accept or reject identities.
- Implement logic to determine the final identity based on combined scores.

Building the Matlab Multi Biometric Identification Source Code

Setting Up Your Environment

- Ensure Matlab is installed with relevant toolboxes:
- Image Processing Toolbox
- Statistics and Machine Learning Toolbox
- Organize datasets into structured folders for each modality and individual.

Step 1: Data Loading and Preprocessing

Begin by loading biometric datasets:

```
```matlab

% Load fingerprint images

fingerprints = imageDatastore('dataset/fingerprints');

% Load face images

faces = imageDatastore('dataset/faces');

% Load iris images

irises = imageDatastore('dataset/irises');

```
```

Preprocessing may include:

```
```matlab

% Example: Normalize images

for i = 1:length(fingerprints.Files)

img = readimage(fingerprints, i);

img = im2double(img);

img = imadjust(img);

```

```
% Save or process further
```

```
end
```

```
'''
```

## Step 2: Feature Extraction

Extract features specific to each modality:

Fingerprint Features:

- Minutiae extraction using ridge endings and bifurcations.
- Use existing algorithms or implement custom filters.

```
```matlab
```

```
% Example: Apply Gabor filters for ridge enhancement
```

```
gaborArray = gaborFilterBank(5,8,39,6);
```

```
enhancedFingerprint = gaborFeatures(img, gaborArray);
```

```
'''
```

Face Features:

- Use Principal Component Analysis (PCA) or Local Binary Patterns (LBP).

```
```matlab
```

```
% Example: Extract LBP features
```

```
lbpFeatures = extractLBPFeatures(rgb2gray(faceImage));
```

```
'''
```

Iris Features:

- Segmentation, normalization, and feature encoding (e.g., phase code).

```
```matlab
```

```
% Pseudocode for iris feature extraction
```

```
irisCode = encodeIrisFeatures(irisImage);
```

```
```
```

### Step 3: Feature Fusion

Concatenate feature vectors:

```
```matlab
```

```
fusionFeatures = [fingerprintFeatures, faceFeatures, irisFeatures];
```

```
```
```

Or implement score-level fusion after individual matching:

```
```matlab
```

```
scoreFingerprint = computeMatchingScore(fingerprintTemplate, inputFingerprint);
```

```
scoreFace = computeMatchingScore(faceTemplate, inputFace);
```

```
scoreIris = computeMatchingScore(irisTemplate, inputIris);
```

```
% Fusion rule: weighted sum
```

```
finalScore = w1scoreFingerprint + w2scoreFace + w3scoreIris;
```

```
```
```

### Step 4: Classification and Matching

Compare input features to stored templates:

```
```matlab
```

% Example: Using Euclidean distance

```
distance = norm(fusionFeatures - storedFeatures);
```

```
if distance  
disp('Identity Matched');
```

```
else
```

```
disp('No Match Found');
```

```
end
```

```
````
```

## Step 5: Decision Making and Output

Apply fusion rules:

- Threshold-based decision: Accept if combined score exceeds a threshold.
- Majority voting: For decision-level fusion.

```
``matlab
```

```
if finalScore > acceptanceThreshold
```

```
disp('Authentication Successful');
```

```
else
```

```
disp('Authentication Failed');
```

```
end
```

```
````
```
