Introduction to Basic Stoichiometry and the PhET Lab

What is Stoichiometry?

Stoichiometry is the branch of chemistry that deals with numerical relationships between reactants and products in chemical reactions. It involves calculating quantities such as moles, mass, and volume to predict the outcome of chemical processes accurately.

The Role of PhET Simulations

Developed by the University of Colorado Boulder, PhET simulations are interactive tools designed to make science concepts more accessible and engaging. The Basic Stoichiometry PhET Lab allows students to:

- Visualize chemical reactions at the molecular level
- Practice calculating molar ratios
- Understand limiting reactants and theoretical yields
- Conduct virtual experiments safely and conveniently

Having a reliable answer key helps students verify their work and deepen their understanding.

Overview of the Basic Stoichiometry PhET Lab Components

Before diving into the answer key, it is crucial to familiarize yourself with the typical components and

objectives of the lab:

- Reactants selection: Choose different chemicals to react.
- Adjusting quantities: Set initial amounts in moles or grams.
- Running the simulation: Observe the reaction progress.
- Measuring outputs: Record the amount of products formed.
- Calculations: Determine theoretical yields, limiting reactants, and percent yields.

Step-by-Step Guide to the Answer Key for the PhET Lab

The answer key aligns with the typical steps and questions posed during the simulation. Below, we outline common tasks and their solutions.

1. Determining Moles of Reactants

- Given Data: Mass of reactants (e.g., 10 g of Reactant A and 15 g of Reactant B)
- Calculation:
 - Convert grams to moles using molar mass:
 - Moles of Reactant A = $\text{mass (g)} / \text{molar mass (g/mol)}$
 - Moles of Reactant B = $\text{mass (g)} / \text{molar mass (g/mol)}$

Example:

- Reactant A (Molar mass = 50 g/mol): $10 \text{ g} / 50 \text{ g/mol} = 0.2 \text{ mol}$
- Reactant B (Molar mass = 75 g/mol): $15 \text{ g} / 75 \text{ g/mol} = 0.2 \text{ mol}$

Answer:

- Moles of Reactant A = 0.2 mol
- Moles of Reactant B = 0.2 mol

2. Identifying the Limiting Reactant

- Method:
 - Use the balanced chemical equation to find the molar ratio.
 - Compare the available moles of each reactant to the required ratio.

- The reactant that produces the least amount of product is limiting.

Example:

- Balanced equation: $A + 2B \rightarrow \text{Products}$
- Given moles: $A = 0.2 \text{ mol}$, $B = 0.2 \text{ mol}$
- Required for complete reaction:
- A: 0.2 mol
- B: 0.4 mol (because of the 2:1 ratio)

Conclusion:

- B is limiting since only 0.2 mol is available, but 0.4 mol is needed.

Answer:

- Limiting reactant: B

3. Calculating Theoretical Yield

- Steps:
- Use the limiting reactant's moles.
- Apply the molar ratio from the balanced equation to find moles of product formed.
- Convert moles of product to grams if necessary.

Example:

- Moles of limiting reactant (B): 0.2 mol
- From the balanced equation, 2 B produce 1 product:
- Moles of product = $0.2 \text{ mol B} \left(\frac{1 \text{ mol product}}{2 \text{ mol B}} \right) = 0.1 \text{ mol}$
- If the molar mass of the product is 100 g/mol :
- Theoretical yield = $0.1 \text{ mol} \times 100 \text{ g/mol} = 10 \text{ g}$

Answer:

- Theoretical yield of product = 10 g

4. Calculating Percent Yield

- Formula:
- Percent Yield = (Actual Yield / Theoretical Yield) 100%

Example:

- Actual yield obtained from the simulation: 8 g
- Theoretical yield: 10 g
- Calculation:
- Percent Yield = (8 g / 10 g) 100% = 80%

Answer:

- Percent yield = 80%
