Robbins Basic Pathology MCQs

Pathology forms the backbone of medical education, providing essential insights into the mechanisms of disease that underpin clinical practice. Robbins Basic Pathology is one of the most widely used textbooks in this domain, offering comprehensive coverage of fundamental concepts. To reinforce learning and prepare for exams, students often turn to multiple-choice questions (MCQs) based on Robbins content. These Robbins Basic Pathology MCQs serve as an invaluable tool for self-assessment, helping students identify strengths and weaknesses while consolidating their understanding of key pathology topics.

In this article, we will explore some of the most important Robbins Basic Pathology MCQs, organized into major sections covering general pathology, cellular responses, inflammation, hemodynamic disorders, neoplasia, and more. Each section provides detailed explanations to enhance comprehension and aid in exam preparation.

General Pathology MCQs

1. What is the primary cause of cellular injury?

- Genetic mutations
- Infections
- Hypoxia
- Nutrition deficiency

Answer: Hypoxia

Cellular injury predominantly results from hypoxia, which deprives cells of oxygen necessary for aerobic metabolism. While other factors like infections and nutritional deficiencies can cause injury, hypoxia is the most common and fundamental cause.

2. Which of the following is an irreversible form of cell injury?

- Oncosis
- Hydropic change
- Necrosis

- Cell swelling

Answer: Necrosis

Necrosis is an irreversible cell injury characterized by cell swelling, membrane disruption, and uncontrolled release of cellular components, often provoking inflammation.

Cellular Responses to Injury

3. Which type of cellular adaptation involves an increase in cell size?

- Hypertrophy
- Atrophy
- Hyperplasia
- Metaplasia

Answer: Hypertrophy

Hypertrophy is the increase in cell size resulting in tissue enlargement, often in response to increased functional demand, such as muscle hypertrophy in athletes.

4. Metaplasia is best described as:

- A reversible change where one differentiated cell type is replaced by another
- An irreversible injury leading to cell death
- Uncontrolled proliferation of abnormal cells
- A decrease in cell number due to apoptosis

Answer: A reversible change where one differentiated cell type is replaced by another

Metaplasia involves the transformation of one differentiated cell type into another, often as an adaptive response to chronic irritants, e.g., replacement of ciliated columnar epithelium by stratified squamous epithelium in smoker's airways.

Inflammation and Repair MCQs

5. Which of the following is a hallmark of acute inflammation?

- Granuloma formation
- Vasodilation and increased vascular permeability
- Fibrosis
- Chronic infiltration of lymphocytes

Answer: Vasodilation and increased vascular permeability

Acute inflammation is characterized by rapid vasodilation, resulting in redness and heat, along with increased permeability leading to edema and infiltration of neutrophils.

6. Which cell type is primarily involved in chronic inflammation?

- Neutrophils
- Macrophages
- Eosinophils
- Basophils

Answer: Macrophages

Macrophages are central to chronic inflammation, where they phagocytose debris and pathogens, and release cytokines that orchestrate tissue repair and fibrosis.

Hemodynamic Disorders MCQs

7. Pulmonary edema is mainly caused by:

- Decreased plasma oncotic pressure
- Increased hydrostatic pressure
- Capillary permeability
- All of the above

Answer: All of the above

Pulmonary edema can result from increased hydrostatic pressure (e.g., left heart failure), decreased oncotic pressure (e.g., hypoalbuminemia), or increased capillary permeability (e.g., acute respiratory distress syndrome).

8. Which of the following describes thrombosis?

- Formation of a blood clot within a vessel
- Dislodged embolus causing obstruction elsewhere
- Clot formation outside of blood vessels
- Bleeding due to vessel injury

Answer: Formation of a blood clot within a vessel

Thrombosis involves the formation of a fibrin-rich clot within the vascular lumen, which can occlude blood flow and lead to ischemia or infarction.

Neoplasia MCQs

9. Which of the following is a characteristic feature of benign tumors?

- Infiltrative growth
- Metastasis
- Well-differentiated cells
- Rapid mitotic activity

Answer: Well-differentiated cells

Benign tumors tend to resemble the tissue of origin closely (well-differentiated), grow slowly, and do not invade neighboring tissues or metastasize.

10. The most common genetic alteration associated with colorectal carcinoma is:

- KRAS mutation
- p53 mutation
- APC gene mutation
- HER2 amplification

Answer: APC gene mutation

Mutations in the APC gene are early events in colorectal carcinogenesis, leading to dysregulation of Wnt signaling and adenoma formation.

Systemic Pathology MCQs

11. Which condition is characterized by excessive accumulation of amyloid protein in tissues?

- Necrosis
- Hemochromatosis
- Amyloidosis
- Gout

Answer: Amyloidosis

Amyloidosis involves extracellular deposition of amyloid, an insoluble protein that disrupts normal tissue architecture and function.

12. Which of the following is a common cause of secondary (AA) amyloidosis?

- Chronic inflammatory diseases
- Genetic mutations
- Infections with bacteria
- Malignant tumors

Answer: Chronic inflammatory diseases

Chronic inflammatory conditions like rheumatoid arthritis lead to elevated serum amyloid A protein, which deposits as AA amyloid in tissues.

Hypoxia, a deficiency of oxygen in tissues, is the most common cause of reversible cell injury. It impairs oxidative phosphorylation, leading to decreased ATP production, which subsequently causes cellular swelling and fatty change. While ischemia (reduction in blood flow) causes hypoxia, hypoxia alone (such as from respiratory failure) can also induce reversible injury. Toxins and mechanical trauma can cause injury but are less generally reversible or may lead to irreversible

damage depending on severity.

2. Inflammation

Question:

Which cell type predominates in acute inflammation?

- A) Macrophages
- B) Lymphocytes
- C) Neutrophils
- D) Plasma cells

Answer:

- C) Neutrophils

Explanation:

Acute inflammation is characterized by the infiltration of neutrophils, which are the first responders to tissue injury. They are essential for pathogen destruction and debris clearance. Macrophages become prominent in chronic inflammation, while lymphocytes and plasma cells are more associated with adaptive immune responses and chronic processes.

3. Hemodynamic Disorders

Question:

Which of the following is a hallmark of congestive heart failure leading to passive venous congestion?

- A) Hemorrhage
- B) Edema with cyanosis
- C) Purulent exudate
- D) Granuloma formation

Answer:

B) Edema with cyanosis

Explanation:

In congestive heart failure, impaired cardiac function leads to venous congestion, especially in the lungs and liver. This results in increased hydrostatic pressure, causing edema. The affected tissues often appear cyanotic ("blue") due to deoxygenated blood pooling, a classic feature of passive venous congestion.

4. Neoplasia

Question:

Which of the following is the defining feature of malignancy?

- A) Well-differentiation
- B) Rapid growth and invasion
- C) Encapsulation
- D) Uniform cell size

Answer:

B) Rapid growth and invasion

Explanation:

Malignant tumors are characterized by rapid, uncontrolled growth, invasion into surrounding tissues, and potential to metastasize. They often display cellular atypia and loss of differentiation. Well-differentiation and encapsulation are features more typical of benign tumors.

5. Genetic and Molecular Pathology

Question:

A chromosomal translocation t(9;22) is associated with which type of leukemia?

- A) Acute Myeloid Leukemia (AML)
- B) Chronic Myeloid Leukemia (CML)
- C) Acute Lymphoblastic Leukemia (ALL)
- D) Chronic Lymphocytic Leukemia (CLL)

Answer:

- B) Chronic Myeloid Leukemia (CML)

Explanation:

The Philadelphia chromosome, resulting from a translocation between chromosomes 9 and 22 (t(9;22)), is characteristic of CML. This translocation creates the BCR-ABL fusion gene, which encodes a constitutively active tyrosine kinase driving proliferation.

Advanced Topics and Challenging Questions

To deepen understanding, here are some more complex questions that integrate multiple concepts:

6. Systemic Pathology

Question:

A 65-year-old man presents with a history of hypertension and develops a sudden, severe headache. Imaging reveals a subarachnoid hemorrhage. What is the most common cause of this pathology?

- A) Berry aneurysm rupture
- B) Hypertensive hemorrhage
- C) Trauma
- D) Moyamoya disease

Answer:

- A) Berry aneurysm rupture

Explanation:

While hypertensive hemorrhages often involve deep brain structures like the basal ganglia, subarachnoid hemorrhages are most commonly caused by rupture of a saccular ("berry") aneurysm, often located at arterial bifurcations in the Circle of Willis. These aneurysms are prone to rupture, leading to sudden, severe headaches.

7. Tumor Pathology

Question:

Which of the following features is most indicative of a high-grade malignant tumor?

- A) Well-differentiated cells
- B) Low mitotic index
- C) Necrosis and cellular pleomorphism
- D) Encapsulation

Answer:

- C) Necrosis and cellular pleomorphism

Explanation:

High-grade malignancies often exhibit cellular pleomorphism (variability in cell size and shape), high mitotic activity, and necrosis due to rapid growth outstripping blood supply. Well-differentiated tumors and encapsulation are features more common in benign lesions.

Integrating Pathology MCQs into Study and Practice

Incorporating MCQs into study routines offers numerous benefits:

- Active Recall: Testing oneself reinforces memory.
- Exam Simulation: Mimics real exam conditions for better preparedness.
