Sample Managerial Economics Final Exam Questions and Solutions

Below is a curated list of commonly encountered questions along with detailed solutions to help you prepare effectively.

Question 1: Demand Elasticity Calculation

Question:

A firm observes that when the price of its product decreases from \$10 to \$8, the quantity demanded increases from 100 units to 150 units. Calculate the price elasticity of demand and interpret the result.

Solution:

- Identify the initial and final values:
- $P_1 = \$10$, $P_2 = \$8$
- $Q_1 = 100$ units, $Q_2 = 150$ units
- Calculate the percentage change in price:

\[

$$\Delta P = \frac{P_2 - P_1}{P_1} \times 100 = \frac{8 - 10}{10} \times 100 = -20\%$$

\]

- Calculate the percentage change in quantity demanded:

\[

$$\Delta Q = \frac{Q_2 - Q_1}{Q_1} \times 100 = \frac{150 - 100}{100} \times 100 = 50\%$$

]

- Calculate price elasticity of demand (PED):

[

$$\text{PED} = \frac{\Delta Q}{\Delta P} = \frac{50\%}{-20\%} = -2.5$$

]

Interpretation:

Since the absolute value of PED is greater than 1, demand is elastic. A 1% decrease in price results in approximately a 2.5% increase in quantity demanded, indicating that consumers are relatively responsive to price changes.

Question 2: Cost Curves and Profit Maximization

Question:

A firm's total cost (TC) function is given by:

[

$$TC = 100 + 20Q + 5Q^2$$

]

where Q is the quantity produced. The firm's revenue function is $(TR = P \times Q)$, and the market price (P) is \$50. Determine the profit-maximizing output level and the maximum profit.

Solution:

- Calculate Total Revenue (TR):

[

$$TR = P \times Q = 50Q$$

\\

- Find the total cost (TC):

\\

$$TC = 100 + 20Q + 5Q^2$$

\\

- Determine profit function:

\\

$$\pi(Q) = TR - TC = 50Q - (100 + 20Q + 5Q^2)$$

\\

\\

$$\pi(Q) = 50Q - 100 - 20Q - 5Q^2 = (30Q) - 100 - 5Q^2$$

\\

- Find the critical point for profit maximization:

\\

$$\frac{d\pi}{dQ} = 30 - 10Q = 0$$

\\

\\

$$Q = \frac{30}{10} = 3$$

\]

- Verify that this is a maximum:

\[

$$\frac{d^2\pi}{dQ^2} = -10$$

\]

Since the second derivative is negative, $Q = 3$ yields a maximum.

- Calculate maximum profit:

\[

$$\pi(3) = 30(3) - 100 - 5(3)^2 = 90 - 100 - 45 = -55$$

\]

Note: The profit is negative, indicating the firm incurs a loss at this output level. However, based on the profit function, $Q = 3$ is the profit-maximizing output. The firm may need to reconsider pricing or cost structure.

Question 3: Monopoly Pricing and Output Decision

Question:

A monopolist faces the demand function:

\[

$$Q = 120 - 2P$$

\]

and has a total cost function:

\[

$$TC = 200 + 10Q$$

\]

Determine the profit-maximizing price and quantity, along with the profit.

Solution:

- Express price in terms of quantity:

\[

$$P = \frac{120 - Q}{2}$$

\]

- Calculate total revenue:

\[

$$TR = P \times Q = \frac{120 - Q}{2} \times Q = \frac{120Q - Q^2}{2}$$

\]

\[

$$TR = 60Q - \frac{Q^2}{2}$$

\]

- Profit function:

\[

$$\pi(Q) = TR - TC = 60Q - \frac{Q^2}{2} - (200 + 10Q)$$

\]

$$\pi(Q) = 60Q - \frac{Q^2}{2} - 200 - 10Q = (50Q) - \frac{Q^2}{2} - 200$$

- Maximize profit:

$$\frac{d\pi}{dQ} = 50 - Q = 0 \Rightarrow Q = 50$$

- Calculate the corresponding price:

$$P = \frac{120 - 50}{2} = \frac{70}{2} = 35$$

- Calculate maximum profit:

$$\pi(50) = 50 \times 50 - \frac{(50)^2}{2} - 200 = 2500 - 1250 - 200 = 1050$$

Result:

The monopolist should produce 50 units and set the price at \$35 to maximize profit, earning a total profit of \$1050.

Detailed Solutions to Typical Final Exam Questions

Question 1: Explain Price Elasticity of Demand and Its Managerial Significance

Question: What is price elasticity of demand? How does it influence managerial pricing decisions?

Solution:

Definition:

Price elasticity of demand (PED) measures the responsiveness of the quantity demanded of a good to a change in its price. It is calculated as:

$$\text{PED} = \frac{\% \text{ change in quantity demanded}}{\% \text{ change in price}}$$

Interpretation:

- If $\text{PED} > 1$: Demand is elastic (sensitive to price changes).
- If $\text{PED} < 1$: Demand is inelastic.
- If $\text{PED} = 1$: Demand is unit elastic.

Managerial Implications:

- For products with elastic demand, raising prices may reduce total revenue, so firms should consider lowering prices to boost demand.
- For inelastic products, firms can increase prices without significantly reducing quantity demanded, thus increasing revenue.
- Understanding elasticity aids in designing effective pricing strategies, promotions, and product positioning.

Visual Aid:

A demand curve illustrating elastic and inelastic regions can help visualize how changes in price affect quantity demanded.

Question 2: Calculating and Interpreting Price Elasticity of Demand

Question:

Given the data: When the price of a product decreases from \$50 to \$45, the quantity demanded increases from 200 units to 250 units. Calculate the price elasticity of demand and interpret the result.

Solution:

- Calculate percentage change in price:

$$\Delta P = \frac{45 - 50}{50} \times 100 = -10\%$$

- Calculate percentage change in quantity demanded:

$$\Delta Q = \frac{250 - 200}{200} \times 100 = 25\%$$

- Calculate PED using the midpoint formula:

$$\text{PED} = \frac{\Delta Q}{\Delta P} = \frac{25}{-10} = -2.5$$

Interpretation:

Absolute value of PED is 2.5, indicating elastic demand.

Managerial insight:

A 10% decrease in price leads to a 25% increase in quantity demanded, suggesting that lowering prices could significantly increase total revenue.

Question 3: Cost Analysis and Break-Even Point Calculation

Question:

A firm faces the following cost structure: Fixed costs = \$50,000; Variable cost per unit = \$20. The selling price per unit is \$50. How many units must the firm sell to break even?

Solution:

- Determine contribution margin per unit:

$$\text{Contribution Margin} = \text{Price} - \text{Variable Cost} = 50 - 20 = \$30$$

- Calculate break-even point:

$$\text{Break-even units} = \frac{\text{Fixed Costs}}{\text{Contribution Margin per unit}} =$$

$$\frac{50,000}{30} \approx 1667 \text{ units}$$

Managerial Takeaway:

The firm must sell approximately 1,667 units to cover all costs. Understanding this helps in setting sales targets and pricing strategies.

Question 4: Market Structure and Pricing Strategy in Monopoly

Question:

In a monopolistic market, how should the firm determine its profit-maximizing price and output level?

Solution:

Step 1: Understand the Demand Curve

- The monopolist faces the market demand curve, which is downward sloping.

Step 2: Find the Marginal Revenue (MR) and Marginal Cost (MC)

- The profit-maximizing output is where $MR = MC$.

Step 3: Determine the Optimal Price

- Once the profit-maximizing output is identified, use the demand curve to find the corresponding price.

Step 4: Strategic Considerations

- The monopolist can set a higher price and lower output compared to perfect competition to maximize profits.
- Price discrimination opportunities can enhance profits further if feasible.

Example:

Suppose the demand function is $(Q = 100 - 2P)$, and the MC is \$20.

- Derive MR from the demand: $(P = 50 - 0.5Q)$.
- Total revenue $(TR = P \times Q = (50 - 0.5Q)Q = 50Q - 0.5Q^2)$.
- MR = derivative of TR: $(MR = 50 - Q)$.
- Set $MR = MC$: $(50 - Q = 20 \rightarrow Q = 30)$.
- Find price: $(P = 50 - 0.5 \times 30 = 35)$.

Conclusion:

The firm should produce 30 units and charge \$35 per unit.

Strategic Tips for Excelling in Final Exams

To effectively tackle managerial economics final exam questions and solutions, consider the following strategies:

- Master Key Concepts and Formulas:

Memorize essential formulas like elasticity, cost functions, and profit maximization conditions.
