Introduction to Actuarial Formulae and Tables

Actuarial exams encompass a broad array of topics, each with its own set of formulae and tables. The primary areas include:

- Life contingencies
- Financial mathematics
- Probability
- Statistics
- Pension mathematics

Mastering these areas requires familiarity with standard formulae, tables of probability and mortality, and understanding how to apply them in various contexts.

Key Areas and Essential Formulae

1. Life Contingencies

Life contingencies focus on the probability of survival and death, often involving life tables and mortality models.

Life Tables

- Mortality rates (q_x): Probability that a person aged x dies before reaching age $x+1$.
- Survival function (l_x): Number of survivors at age x out of a cohort.

- Number of deaths (d_x): Number of deaths between ages x and $x+1$, calculated as $l_x - l_{x+1}$.

Key Formulae

- Probability of survival:

$${}_t p_x = \frac{l_{x+t}}{l_x}$$

- Probability of death within t years:

$${}_t q_x = 1 - {}_t p_x$$

- Present value of a life insurance (whole life):

$$\bar{A}_x = \sum_{k=0}^{\infty} v^k {}_k p_x q_{x+k}$$

- Present value of an annuity payable while alive:

$$\bar{a}_x = \sum_{k=0}^{\infty} v^k {}_k p_x$$

where $(v = \frac{1}{1+i})$, with (i) being the interest rate.

2. Financial Mathematics

Financial mathematics forms the backbone of pricing and reserving in insurance.

Present and Future Values

- Present value (PV):

$$PV = \sum_{t=1}^n \frac{C_t}{(1+i)^t}$$

- Future value (FV):

$$FV = \sum_{t=1}^n C_t (1+i)^{n-t}$$

Key Formulae for Annuities

- Ordinary annuity (payment at end):

$$\lvert a_{\overline{n}|i} = \frac{1 - v^n}{i} \rvert$$

- Annuity due (payment at start):

$$\lvert a_{\overline{n}|i}^{\text{due}} = a_{\overline{n}|i} \times (1 + i) \rvert$$

- Perpetuities:

$$\lvert a_{\infty|i} = \frac{1}{i} \rvert$$

3. Probability and Statistics

These areas involve calculating probabilities, expected values, variances, and other moments.

Probability Formulae

- Conditional probability:

$$\lvert P(A|B) = \frac{P(A \cap B)}{P(B)} \rvert$$

- Bayes' theorem:

$$\lvert P(A|B) = \frac{P(B|A) P(A)}{P(B)} \rvert$$

Expected Values and Variance

- Expected value (mean):

$$\lvert E[X] = \sum x_i P(X = x_i) \rvert$$

- Variance:

$$\text{Var}(X) = E[X^2] - (E[X])^2$$

Commonly Used Tables in Actuarial Exams

Tables are crucial for simplifying complex calculations, especially those involving probabilities and mortality.

1. Life Tables

Life tables provide age-specific mortality rates and survival probabilities. They are typically categorized into:

- Complete life tables: Showing detailed data across all ages.
- Incomplete life tables: Focusing on specific age bands.

Commonly used tables include:

- Carter-Bryant Life Table
- UK Life Tables (e.g., UK 2018-2020)
- US Life Tables

2. Probability Tables

- Standard Normal Distribution Table (Z-table): Used for calculating probabilities related to standard normal variables.
- t-distribution, Chi-square, F-distribution tables: For various inferential statistics.

3. Interest Rate Tables

Interest tables often provide:

- Present value factors (v^t): For different interest rates and time periods.
- Annuity factors: To quickly determine the value of annuities and perpetuities.

Application of Formulae and Tables in Practice

Understanding how to apply these formulae and tables is fundamental. Here are illustrative examples:

Example 1: Calculating the Life Insurance Present Value

Suppose an individual aged 40 purchases a 10-year life insurance policy with a sum assured of \$100,000. The force of mortality and interest rate are given, and the relevant life table provides ${}_t p_x$ and ${}_t q_x$.

Step-by-step:

- Use the life table to find ${}_t p_{40}$ and ${}_t q_{41}, {}_t q_{42}, \dots, {}_t q_{50}$.
- Calculate the probability of death in each year.
- Discount the sum assured by the probability of death in each year:

$$PV = 100,000 \times \sum_{k=1}^{10} v^k \cdot {}_k p_{40} \cdot {}_k q_{40+k-1}$$

- Use present value interest factors from tables to expedite calculations.

Example 2: Valuing an Annuity Due

Calculate the present value of an annual payment of \$1,000 made at the beginning of each year for 20 years, with an interest rate of 5%.

Solution:

- Find the annuity due factor:

$$\overline{a}_{\overline{20}|i} = \frac{1 - v^{20}}{i} \times (1 + i)$$

- Use the interest table to get $v = \frac{1}{1.05}$.
- Perform calculations to find the present value.
