Introduction to DNA to Protein Synthesis

DNA (Deoxyribonucleic Acid) is the hereditary material in all living organisms, containing the instructions necessary for building proteins. The process of converting genetic information from DNA into functional proteins involves two main stages:

- Transcription: The process of copying a gene's DNA sequence into messenger RNA (mRNA).
- Translation: The process where the mRNA is decoded to assemble amino acids into a specific protein.

Understanding these processes is vital for students and researchers alike. A typical lab experiment simulating or analyzing this process helps solidify theoretical knowledge through practical application.
