1. Control System Fundamentals and Modeling

- **Question:** A first-order control system has a transfer function given by $G(s) = \frac{K}{\tau s + 1}$. If the system's time constant (τ) is 2 seconds and the gain (K) is 4, what is the steady-state output when a unit step input is applied?

- **Answer:** The steady-state output is equal to the system gain (K) , so 4.

- **Question:** Derive the transfer function for a mass-spring-damper system with mass $(m = 5\text{ kg})$, damping coefficient $(c = 10\text{ Ns/m})$, and spring constant $(k = 200\text{ N/m})$.

- **Answer:** The transfer function from force input $(F(s))$ to displacement $(X(s))$ is $\frac{X(s)}{F(s)} = \frac{1}{ms^2 + cs + k} = \frac{1}{5s^2 + 10s + 200}$.

2. System Response and Stability

- **Question:** A control system has a characteristic equation $(s^2 + 4s + 5 = 0)$. Determine whether the system is stable, and justify your answer.

- **Answer:** The roots are $(s = -2 \pm j1)$. Since both roots have negative real parts, the system is stable.

- **Question:** For a unity feedback system with open-loop transfer function $(G(s)H(s) = \frac{K}{s(s+2)})$, find the value of (K) that causes the system to be on the verge of instability (i.e., marginal stability).

- **Answer:** Using the Routh-Hurwitz criterion, the critical value of (K) is $(K = 4)$.

3. Frequency Response and Bode Plots

- **Question:** Given $(G(s) = \frac{10}{s+1})$, what is the magnitude of the transfer function at $(\omega = 1\text{ rad/sec})$?

- **Answer:** $(|G(j\omega)| = \frac{10}{\sqrt{1^2 + 1^2}} = \frac{10}{\sqrt{2}} \approx 7.07)$.

- **Question:** Sketch the Bode magnitude plot for $G(s) = \frac{1}{(s+1)(s+10)}$. Identify the corner frequencies and approximate the magnitude at each point.

- **Answer:** Corner frequencies at 1 rad/sec and 10 rad/sec; magnitude decreases at -20 dB/decade after each corner.

4. Controller Design and Tuning

- **Question:** Design a proportional-derivative (PD) controller for a system with transfer function $G(s) = \frac{1}{s+1}$ to improve transient response. Specify the controller gains if the desired damping ratio is 0.7 and natural frequency is 2 rad/sec.

- **Answer:** Use root locus or pole placement methods to select gains; approximate gains are $K_p \approx 3.2$, $K_d \approx 1.5$ based on standard design procedures.

- **Question:** Explain the process of tuning a PID controller using the Ziegler-Nichols method for a system with a known ultimate gain K_u and ultimate period T_u .

- **Answer:** Increase the proportional gain until sustained oscillations occur; record K_u and T_u . Then set PID parameters based on empirical formulas: $K_p = 0.6 K_u$, $K_i = 2K_p/T_u$, $K_d = K_p T_u/8$.
